Tables S1 to S44

Information about the sample

Table S1 provides the distribution of the demographics of the college students in our main experiment. Figure S2 shows differences in universalistic versus particularistic principle support by demographics. Figure S1 shows the geographic distribution of our respondents.

Wording for Experiments

The full questionnaire that includes all variables that were collected appears on the OSF page: <https://osf.io/85hfq/>

Professor Experiment

Stimuli Imagine that in [context], a professor from your college expressed their opinion that [group][play the victim to get special treatment OR the U.S. will be a better place without] [group].

Context: campus protest, a class, or a private text message

Target group identity: Black/Jewish/white/Muslim/Transgender

Speech severity: play the victim to get special treatment/the U.S. will be a better place without

Follow-up Questions How likely is it that the professor's statement causes harm? (Very unlikely / Unlikely / Neutral / Likely / Very likely)

How should the university respond? (Do nothing/Publicly condemn but refrain from punishment/Punish (without suspension)/Suspend without pay for a fixed term/Fire)

Student Experiment

Stimuli [Randomized to one statement and one target group]

Most [Jews/Muslims] in America are more loyal to [Israel/Islam] than to the USA.

Most [Jews/Muslims] use shady practices to get what they want.

Most [Jews are Zionists/Muslims are Jihadists] promote an oppressive ideology.

The world would be better off with fewer [Jews/Muslims].

[Jews/Muslims] are the root of all evil and must be dealt with by any means necessary.

Follow-up Questions Is this sentence hate speech? Options: Not offensive/ Offensive but not hate speech/ Yes, hate speech

How should the university respond to a repeat offender? Options: Do nothing/Publicly condemn/Punish (without suspension)/Suspend without pay/Expel

The Policy Experiment

Would you favor or oppose a rule making it a violation of campus policies to say offensive things in public against [Black/Jewish/white/Muslim/Transgender] people? (Strongly support / Support / Neither oppose nor support / Oppose / Strongly oppose)

Additional Survey Questions

1. Many people have taken sides in the current war between Israel and Hamas. Which group do you sympathize with more strongly in the context of the Israeli-Palestinian conflict?

- Israeli people
- Palestinian people
- Both equally
- Neither
- I prefer not to answer

2. On October 7, 2023, Hamas brigades invaded Israel, killing over 1,100 Israeli citizens, including elderly people, women, babies, and unarmed men. Please give your opinion on the following two statements:

Statement A: October 7 was a horrific terror attack that cannot, and should not, be justified under any circumstances.

Statement B: October 7 was a legitimate act of armed resistance to decades of Israeli occupation.

Do you agree more with statement A or statement B?

- A
- B
- Neither
- Don't know

3. Now think about October 6, 2023, a day before Hamas's terror attack on Israel. At that time, which group did you sympathize with more strongly?
 - Israeli people
 - Palestinian people
 - Both equally
 - Neither
 - I prefer not to answer
4. On a scale from 0 to 10, where 0 represents the most pro-Israel position and 10 represents the most pro-Palestinian position, how would you rate the position of the following individuals/groups?
 - Yourself
 - Most students on your campus
 - The university administration/leadership
 - Most professors on your campus
5. On a scale from 0 to 10, where 0 represents the most pro-Palestinian position and 10 represents the most pro-Israel position, how would you rate the position of the following individuals/groups?
 - Yourself
 - Most students on your campus
 - The university administration/leadership
 - Most professors on your campus
6. How important is protecting free speech and open expression on college campuses?
 - Very important
 - Somewhat important
 - Not very important
 - Not important at all

Additional Pre-Registered Experiments

This section includes results from three other experiments that appeared in the survey instrument.

Real Statements Experiment

In order to introduce some more realism to the survey, we presented respondents with one of four true stories we have culled from running online search. Two of the stories are objectionable but not necessarily harmful (1-2), and two stories describe speech that is arguably hateful (3-4). Respondents read the following question: *Below is a real story of a university professor who made comments that some might find objectionable and harmful.*

1. A professor posted on social media after the death of the former First Lady Barbara Bush, the wife of President George W. H. Bush, "*I'm happy the witch is dead. Can't wait for the rest of her family to fall to their demise the way 1.5 million Iraqis have. Byyyeeeeeeee.*"
2. A university sent a mass email encouraging all faculty members to participate in Diversity, Equity, and Inclusion (DEI) training. A professor replied, mocking the DEI event and discouraging participation, adding, "*The event will be anti-intellectual and totalitarian: there'll be bromides, clichés, and amen-corner rah-rahs in plenty.*"
3. Professor posted on social media, "*All I want for Christmas is white genocide.*"
4. A professor was asked in class about their view on Colin Kaepernick, the NFL quarterback who knelt during the national anthem to protest police violence against Black people. Their response was, "*I would kill him*".

World Events Experiment

Do you believe that your university should publish official statements in response to significant world events, such as [randomize: George Floyd's murder; Hamas's attack on Israel on October 7; Israel's invasion of Rafah; the 2016 gay nightclub shooting; the Russia-Ukraine conflict], or should it avoid taking an official position?

- The university should publish official statements

- The university should not issue official statements
- Don't know

The results appear in Table ??.

Campus events

Some students believe that controversial speakers should not be allowed to speak on campus since inviting them to campus threatens inclusivity and legitimizes their position. Others believe that academic freedom means allowing even objectionable voices to be heard and that banning speech on campus runs the danger of a slippery slope.

Now, assume the following has been invited to speak at a campus event. Do you think the university should intervene and cancel the event with [randomize: Benjamin Netanyahu, Prime Minister of Israel and leader of the right party “Likud”; Enrique Tarrio, leader of Proud Boys, a far-right group; George Soros, a Businessman and philanthropist for liberal causes; Ismail Haniyeh, the leader of Hamas’s political arm; Itamar Ben-Gvir, Israel’s National Security Minister and leader of the far-right party “Jewish Power”; Mahmoud Abbas, the President of the Palestinian Authority; Rupert Murdoch, Media executive (Fox News) and philanthropist for conservative causes; Samuel Miller, an activist with Antifa, a far left group]

Results from this experiment appear in Tables ?? and ??

Subgroup analyses

We examine whether the results differ by respondent race (white non-Hispanic, Black, Hispanic, Asian, other), attitudes toward Israel and Palestine, and the the partisanship of the respondent’s states. These results appear in Figure S9 through Figure S22.

Adult Replication (CloudResearch Connect): Design, Measures, and Results

To complement the (partly) exploratory analyses in the student wave, we fielded a follow-up experiment among U.S. adults (N=2000) recruited via CloudResearch Connect in November 2025. We re-ran the *policy*, *professor*, and *student* experiments using the same vignettes and primary outcomes, allowing us to assess generalizability across both populations and time. The pre-registration appears in the OSF directory.

Measures and harmonization. In addition to the main outcomes reported in the student wave, the replication added two harmonized outcomes to *both* the professor and student experiments so that *all* respondents were asked: (i) whether the statement constitutes hate speech, and (ii) whether the statement is likely to cause physical or psychological harm. This ensures comparable “hate” and “harm” measures across all conditions and targets.

Results summary. The results for the adult replication appear in Figures [S23:S26](#) and on the OSF page. The adult replication reproduces the core findings from the student sample and closely matches the size of the main effects. For example, in the professor experiment, harmful speech about Black people increases support for firing the professor by 0.33 in the student sample and 0.21 in the adult sample, with similarly close correspondence for Jewish and Muslim targets. In the policy experiment, target-group effects on support for banning offensive statements are larger in the student data than in the adult sample (≈ 0.30 – 0.38 vs. 0.14 – 0.20 among adults), and the pattern of greater protection for minority targets than for White targets is identical across samples. When we stratify by speech principles, ideology, and sympathies, the direction and structure of the interactions are the same in both studies; some subgroup contrasts are modestly smaller and less precisely estimated in the adult data, but we do not observe any sign reversals or qualitatively new patterns. The main difference between samples lies in the distribution of principles: students are more likely to endorse particularistic protections, whereas adults are roughly evenly divided between particularists and universalists.

Complete materials and outputs. All replication materials—including stimuli, code, machine-readable tables, and de-identified data—are available on our OSF project page: [Open Science Framework](#).

Notes on analysis. Unless otherwise noted, models, coding, and specifications follow those described in the Materials and Methods for the student wave; any deviations are documented in the OSF analysis scripts.

Figure S14: Predicted probabilities from speaker event experiment models by respondent race.

Figure S15: Predicted probabilities from real professor statement experiment models by respondent race.

Figure S16: Predicted probabilities from world events experiment models by respondent race.

Figure S17: Predicted probabilities from professor experiment models by respondent Israel-Palestine sympathy.

Figure S18: Predicted probabilities from student experiment models by respondent Israel-Palestine sympathy.

Figure S19: Predicted probabilities from policy experiment models by respondent Israel-Palestine sympathy.

Figure S20: Predicted probabilities from speaker event experiment models by respondent Israel-Palestine sympathy.

Figure S21: Predicted probabilities from real professor statement experiment models by respondent Israel-Palestine sympathy.

Figure S22: Predicted probabilities from world events experiment models by respondent Israel-Palestine sympathy.

Figure S23: **Main effects by target, severity, and context (Adult Replication of of Fig. 1).** Coefficients from the pre-registered linear probability models for the three experiments: (A) *professor* (left: support for firing; right: perceived physical/psychological harm), (B) *student* (left: support for suspension/expulsion; right: hate-speech classification), and (C) *policy* (support for a rule banning offensive public statements targeting a randomized group). Dots show point estimates with 95% CIs. Reference categories: *white* targets; “*play the victim to get special treatment*” (professor severity) and “*not loyal*” (student severity); *private text* (professor context). Binary outcomes are coded as described in the Methods (e.g., firing=1 vs otherwise; suspend/expel=1 vs otherwise; hate-speech=yes=1; policy support=somewhat/strongly support=1).

Figure S24: **Support for speech restrictions by stated principle (Adult Replication of Fig. 2).** Replicates Fig. 1's target-identity contrasts after splitting the sample by stated principle: *particularist* (rules may consider target identity) vs *universalist* (rules should not consider identity). Panels report effects on (A) firing and perceived harm in the professor experiment, (B) suspension/expulsion and hate-speech in the student experiment, and (C) support for group-specific policies. Dots show linear probability model coefficients with 95% CIs; reference categories follow the main-text specification (white targets; least severe statement; private text context)

Figure S25: **Principles $\times$ political ideology (Adult replication of Fig. 3).** Estimated effects of target identity on (A) firing a professor, (B) suspending/expelling a student, and (C) supporting group-specific policy, shown separately for universalists (blue) and particularists (red) within ideological groups (left, center, right). Models match the pre-registered specifications; dots are LPM coefficients with 95% CIs. Reference categories: white targets; least severe statement; private text context.

Figure S26: **Principles $\times$ Israel/Palestine sympathies (Adult replication of Fig. 4).** Estimated effects of target identity on (A) firing a professor, (B) suspending/expelling a student, and (C) supporting group-specific policy, shown separately for universalists (blue) and particularists (red) within sympathy strata defined from a continuous index: bottom quartile (more pro-Palestine), middle 50% (ambivalent), and top quartile (more pro-Israel). Models mirror the main-text specifications; dots are LPM coefficients with 95% CIs. Reference categories: white targets; least severe statement; private text context.

Other	345 (11.6%)
Sexual Orientation	
LGBTQ+	988 (33.3%)
Straight	1978 (66.7%)

Student Views on Speech Restrictions by Target and Severity

These tables present results from three experiments assessing support for punishing speech on university campuses. The experiments involved randomized variations in the target group and speech severity, which are estimated in separate regressions. Regression models are described in the Materials and Methods section. Labels are added for statistical significance.

Support for Speech Restrictions by Principles

These tables present results focusing on the identity of the target of speech, but subsets the sample by respondents who adhere to particularistic or universalistic principles. It shows estimated effects on support for firing a professor, expelling a student, or endorsing group-specific policies. We include all randomized variables in the models. Regression models are described in the Materials and Methods section. Labels are added for statistical significance
